First Edition – August 16, 2010

Hewlett Packard Company (HP) believes that the information in this document is accurate as of the publication date. The information in this document is subject to change without notice. HP assumes no responsibility for any errors that may appear in this document. The pricing information in this document is believed to accurately reflect the current prices as of the publication date. However, HP provides no warranty of the pricing information in this document.

Benchmark results are highly dependent upon workload, specific application requirements, and system design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC Benchmark C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

All performance data contained in this report were obtained in a rigorously controlled environment. Results obtained in other operating environments may vary significantly. HP does not warrant or represent that a user can or will achieve similar performance expressed in transactions per minute (tpmC) or normalized price/performance ($/tpmC). No warranty of system performance or price/performance is expressed or implied in this report.

Table of Contents

Preface

The TPC Benchmark C was developed by the Transaction Processing Performance Council (TPC). The TPC was founded to define transaction processing benchmarks and to disseminate objective, verifiable performance data to the industry. This full disclosure report is based on the TPC Benchmark C Standard Specifications Version 5.10.1, released February 2009.

TPC Benchmark C Overview

The TPC describes this benchmark in Clause 0.1 of the specifications as follows:

TPC Benchmark C is an On Line Transaction Processing (OLTP) workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. It does so by exercising a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity
- On-line and deferred transaction execution modes
- Multiple on-line terminal sessions
- Moderate system and application execution time
- Significant disk input/output
- Transaction integrity (ACID properties)
- Non-uniform distribution of data access through primary and secondary keys
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships
- Contention of data access and update

The performance metric reported by TPC-C is a "business throughput" measuring the number of orders processed per minute. Multiple transactions are used to simulate the business activity of processing an order, and each transaction is subject to a response time constraint. The performance metric for this benchmark is expressed in transactions-per-minute-C (tpmC). To be compliant with the TPC-C standard, all references to tpmC results must include the tpmC rate, the associated price-per-tpmC, and the availability date of the priced configuration.

TPC-C uses terminology and metrics that are similar to other benchmarks, originated by the TPC or others. Such similarity in terminology does not in any way imply that TPC-C results are comparable to other benchmarks. The only benchmark results comparable to TPC-C are other TPC-C results conformant with the same revision.

Despite the fact that this benchmark offers a rich environment that emulates many OLTP applications, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the results reported by a vendor is highly dependent on how closely TPC-C approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to other environments are not recommended.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, TPC-C should not be used as a substitute for a specific customer application benchmark when critical capacity planning and/or product evaluation decisions are contemplated.

Prices used in TPC benchmarks reflect the actual prices a customer would pay for a one-time purchase of the stated components. Individually negotiated discounts are not permitted. Special prices based on assumptions about past or future purchases are not permitted. All discounts reflect standard pricing policies for the listed components. For complete details, see the pricing sections of the TPC benchmark pricing specifications. If you find that the stated prices are not available according to these terms, please inform the TPC at pricing@tpc.org. Thank you.

Checkpoint interval (average)	26:18

Abstract

Overview

This report documents the methodology and results of the TPC Benchmark C test conducted on the hp ProLiant ML350 G6. The operating system used for the benchmark was Oracle Enterprise Linux. The DBMS used was Oracle Database 11g Standard Edition One.

TPC Benchmark C Metrics

The standard TPC Benchmark C metrics, tpmC (transactions per minute), price per tpmC (three year capital cost per measured tpmC), and the availability date are reported as:

290,040 tpmC
$0.39 USD per tpmC
4.22 watts/KtpmC
Available as of August 16, 2010.

Standard and Executive Summary Statements

The following pages contain an executive summary of results for this benchmark.

Auditor

The benchmark configuration, environment and methodology were audited by Lorna Livingtree of Performance Metrics Inc. to verify compliance with the relevant TPC specifications.

General Items

Application Code and Definition Statements

The application program (as defined in clause 2.1.7) must be disclosed. This includes, but is not limited to, the code implementing the five transactions and the terminal input output functions.

Appendix A contains all source code implemented in this benchmark.

Test Sponsor

A statement identifying the benchmark sponsor(s) and other participating companies must be provided.

This benchmark was sponsored by Hewlett Packard Company. The benchmark was developed and engineered by Hewlett Packard Company and Oracle Corporation. Testing took place at HP Performance Engineering Laboratory in Houston, Texas.

Parameter Settings

Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including by not limited to:

- *Database options*
- *Recover/commit options*
- *Consistency locking options*
- *Operating system and application configuration parameters*

This requirement can be satisfied by providing a full list of all parameters.

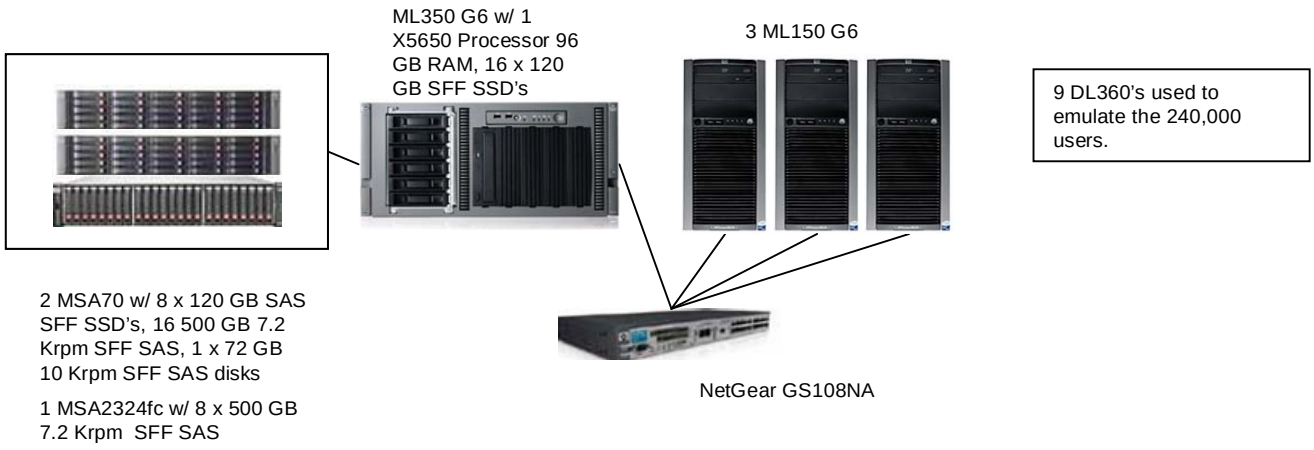
Appendix C contains the tunable parameters for the database, the operating system, and the transaction monitor.

Configuration Items

Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences.

The configuration diagram for both the tested and priced system are the same and included below.

Figure 1. Benchmarked and Priced Configuration



Clause 1 Related Items

Table Definitions

Listing must be provided for all table definition statements and all other statements used to set up the database.
Appendix B contains the code used to define and load the database tables.

Physical Organization of Database

The physical organization of tables and indices within the database must be disclosed.
24 Solid State Disks (SSD's) used in the benchmark had a capacity of 111.8 GB, and 24 disks used in the benchmark had a capacity of 146.8 GB 10K rpm.

Controller	Slot	#disks	Objects
P410i	0	4 120GB SFF SSD's	database tables/indexes
P410	1	4 120GB SFF SSD's	database tables/indexes
P410	2	4 120GB SFF SSD's	database tables/indexes
P410	3	4 120 GB SFF SSD's	database tables/indexes
P411	4	4 120 GB SFF SSD's	database tables/indexes
P411	4	16 500 GB SFF SAS 7.2K rpm	backup
P411	5	4 120 GB SFF SSD's	database tables/indexes
P411	5	1 72 GB SFF SAS 10K rpm	O/S
FC2142SR	6	8 500 GB SFF SAS 7.2K rpm	DB logs

Priced Configuration:

All hardware and software remained the same between the benchmarked and priced configurations.

Insert and Delete Operations

It must be ascertained that insert and/or delete operations to any of the tables can occur concurrently with the TPC-C transaction mix. Furthermore, any restrictions in the SUT database implementation that precludes inserts beyond the limits defined in Clause 1.4.11 must be disclosed. This includes the maximum number of rows that can be inserted and the minimum key value for these new rows.

All insert and delete functions were verified to be fully operational during the entire benchmark.

Partitioning

While there are a few restrictions placed upon horizontal or vertical partitioning of tables and rows in the TPC-C benchmark, any such partitioning must be disclosed.

None.

Replication, Duplication or Additions

Replication of tables, if used, must be disclosed. Additional and/or duplicated attributes in any table must be disclosed along with a statement on the impact on performance.

No replications, duplications or additional attributes were used in this benchmark.

Clause 2 Related Items

Random Number Generation

The method of verification for the random number generation must be described.

Random numbers were generated using the drand48() and lrand48() UNIX calls. These functions generate pseudo random numbers using the linear congruential algorithm and 48-bit integer arithmetic. The random number generators are initially seeded using the srand48() call.

Input/Output Screen Layout

The actual layout of the terminal input/output screens must be disclosed.

All screen layouts followed the specifications exactly.

Priced Terminal Feature Verification

The method used to verify that the emulated terminals provide all the features described in Clause 2.2.2.4 must be explained. Although not specifically priced, the type and model of the terminals used for the demonstration in 8.1.3.3 must be disclosed and commercially available (including supporting software and maintenance).

The terminal attributes were verified by the auditor manually exercising each specification on a representative system.

Presentation Manager or Intelligent Terminal

Any usage of presentation managers or intelligent terminals must be explained.

Application code running on the client machines implemented the TPC-C user interface. No presentation manager software or intelligent terminal features were used. The source code for the forms applications is listed in Appendix A.

Transaction Statistics

Table 2.1 lists the numerical quantities that Clauses 8.1.3.5 to 8.1.3.11 require.

Table 2. 1 Transaction Statistics

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse	85.01%
	Remote warehouse	14.99%
	Accessed by last name	60.00%
Order Status	Accessed by last name	59.99%
Delivery	Skipped transactions	none
Transaction Mix	New Order	44.996%
	Payment	43.002%
	Order status	4.001%
	Delivery	4.001%
	Stock level	4.001%

Queuing Mechanism

The queuing mechanism used to defer the execution of the Delivery transaction must be disclosed.

Microsoft COM+ on each client system served as the queuing mechanism to the database. Each delivery request was submitted to Microsoft COM+ asynchronously with control being returned to the client process immediately and the deferred delivery part completing asynchronously.

Clause 3 Related Items

Transaction System Properties (ACID)

The results of the ACID tests must be disclosed along with a description of how the ACID requirements were met. This includes disclosing which case was followed for the execution of Isolation Test 7.

All ACID property tests were successful. The executions are described below.

Atomicity

The system under test must guarantee that the database transactions are atomic; the system will either perform all individual operations on the data or will assure that no partially completed operations leave any effects on the data.

Completed Transactions

A row was randomly selected from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was committed and the rows were verified to contain correctly updated balances.

Aborted Transactions

A row was randomly selected from the warehouse, district and customer tables, and the balances noted. A payment transaction was started with the same warehouse, district and customer identifiers and a known amount. The payment transaction was rolled back and the rows were verified to contain the original balances.

Consistency

Consistency is the property of the application that requires any execution of a database transaction to take the database from one consistent state to another, assuming that the database is initially in a consistent state.

Consistency conditions one through four were tested using a shell script to issue queries to the database. The results of the queries verified that the database was consistent for all four tests.

A run was executed under full load over two hours with checkpoints.

The shell script was executed again. The result of the same queries verified that the database remained consistent after the run.

Isolation

Sufficient conditions must be enabled at either the system or application level to ensure the required isolation defined above (clause 3.4.1) is obtained.

Isolation tests one through nine were executed using shell scripts to issue queries to the database. Each included timestamps to demonstrate the concurrency of operations. The results of the queries were captured to files. The captured files were verified by the auditor to demonstrate the required isolation had been met.

Isolation test 7 followed Case D, where T3 does not stall and no transaction is ROLLED BACK. T4 query of item price verifies to the changed prices of T3.

Durability

The tested system must guarantee durability: the ability to preserve the effects of committed transaction and insure database consistency after recovery from any one of the failures listed in Clause 3.5.3.

Durable Media Failure

The durable media failure was demonstrated on the full configuration but using only 125,000 active users.

Loss of Log and Data

To demonstrate recovery from a permanent failure of durable medium containing TPC-C tables, the following steps were executed:

1. All partitions on a controller were backed up.
2. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count. Consistency check 3 was verified before run.
3. The RTE was started with 240,000 users
4. The test was allowed to run for a minimum of 5 minutes.
5. A disk was removed from the MSA2324fc that was a log disk.
6. The system continued running due to the fact that the logs are on raid10 devices.
7. The run was allowed to continue for 5 minues.
8. A disk was removed from the array of disks that was backed up.
9. Oracle recorded I/O errors and crashed. The database and the RTE were then shut down.
10. New drives replaced the removed ones, and reconfigured.
11. The database partitions which were backed up in Step 1 were restored.
12. The database was then started. The database was opened and Oracle performed instance recovery.
13. Consistency conditions were executed and verified.
14. Step 2 was repeated and the difference between the first and second counts was noted.
15. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
16. The counts in step 14 and 15 were compared and the results verified that all committed transactions had been successfully recovered.
17. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Instantaneous Interruption, Loss of Memory

Because loss of power erases the contents of memory, the instantaneous interruption and the loss of memory tests were combined into a single test. This test was executed on a fully scaled database of 8000 warehouses under a full load of 80000 users. The following steps were executed:

1. The total number of New Orders was determined by the sum of D_NEXT_O_ID of all rows in the DISTRICT table giving the beginning count.
2. The RTE was started with 240,000 users.
3. The test was allowed to run for a minimum of 5 minutes.
4. A system crash and loss of memory were induced by pulling the power plugs out of the computer. No battery backup or Uninterruptible Power Supply (UPS) were used to preserve the contents of memory.
5. The RTE was shutdown.
6. Power was restored and the system restarted.
7. Oracle10g was restarted and performed an automatic recovery.
8. Consistency conditions were executed and verified.
9. Step 1 was repeated and the difference between the first and second counts was noted.
10. An RTE report was generated for the entire run time giving the number of NEW-ORDERS successfully returned to the RTE.
11. The counts in step 9 and 10 were compared and the results verified that all committed transactions had been successfully recovered.
12. Samples were taken from the RTE files and used to query the database to demonstrate successful transactions had corresponding rows in the ORDER table.

Clause 4 Related Items

Initial Cardinality of Tables

The cardinality (e.g. number of rows) of each table, as it existed at the start of the benchmark run, must be disclosed. If the database was over-scaled and inactive rows of the WAREHOUSE table were deleted, the cardinality of the WAREHOUSE table as initially configured and the number of rows deleted must be disclosed.

Table 4.1 Number of Rows for Server

Table	Occurrences
Warehouse	24,000
District	240,000
Customer	720,000,000
History	720,000,000
Order	720,000,000
New Order	216,000,000
Order Line	7,200,182,048
Stock	2,400,000,000
Item	100,000
Unused Warehouses	0

Database Layout

The distribution of tables and logs across all media must be explicitly depicted for tested and priced systems.

The database datafiles which contain table and index information are stored on the following hardware

- Four P410 SMART Array SAS RAID Controllers, each of which was attached to 4 x 120 GB SFF Solid State Disks.
- Two P411 SMART Array SAS RAID Controllers, each attached to a D2700 containing four 120 GB SFF Solid State Disks

The database logfiles were stored on eight 500 GB 7.2K rpm SFF SAS disk drives in the MSA2324fc attached to the fibre channel controller in slot 6.
The system O/S was located in the D2700 attached to the controller in slot 5. It consisted of a single 72 GB 10K rpm SFF SAS disk drive for the O/S.

The P411 Smart Array Controller accelerator caches were enabled for 100% write. The MSA2324FC, which contained the log disks, cache configuration was set to fault tolerant active-active. The database logfiles were configured as a single RAID-10 volume.

Section 1.2 of this report details the distribution of database tables and logs across all disks. The code that creates the database and tables are included in Appendix B.

Type of Database

A statement must be provided that describes:

1. *The data model implemented by DBMS used (e.g. relational, network, hierarchical).*
2. *The database interface (e.g. embedded, call level) and access language (e.g. SQL, DL/1, COBOL read/write used to implement the TPC-C transaction. If more than one interface/access language is used to implement TPC-C, each interface/access language must be described and a list of which interface/access language is used with which transaction type must be disclosed.*

Oracle Database 10g Edition One is a relational DBMS.

Anonymous block PL/SQL and stored procedures were accessed through the ORACLE Call Interface. Application code is included in Appendix A.

Database Mapping

The mapping of database partitions/replications must be explicitly described.

The database was not replicated. The tables were not partitioned.

60 Day Space

Details of the 60 day space computations along with proof that the database is configured to sustain 8 hours of growth for the dynamic tables (Order, Order-Line, and History) must be disclosed.

Clause 5 Related Items

Throughput

Measured tpmC must be reported

Measured tpmC 290,040 tpmC
Price per tpmC $0.39 USD per tpmC
Watts per KtpmC 4.11 watts/KtpmC

Response Times

Ninetieth percentile, maximum and average response times must be reported for all transaction types as well as for the menu response time.

Table 5.1: Response Times

Type	Average	Maximum	90th %
New-Order	0.70	5.30	1.12
Payment	0.66	5.25	1.06
Order-Status	0.68	3.91	1.09
Interactive Delivery	0.61	3.33	1.02
Deferred Delivery	0.05	0.80	0.11
Stock-Level	1.01	4.76	1.50
Menu	0.62	4.94	1.02

Keying and Think Times

The minimum, the average, and the maximum keying and think times must be reported for each transaction type.

Table 5.2: Keying Times/Think Times

Type	Minimum	Average	Maximum
New-Order	18.01/0.00	18.01/12.05	18.10/120.49
Payment	3.01/0.00	3.01/12.01	3.02/120.10
Order-Status	2.01/0.00	2.01/10.01	2.02/100.08
Interactive Delivery	2.01/0.00	2.01/5.02	2.02/50.19
Stock-Level	2.01/0.00	2.01/5.01	2.02/50.09

Response Time Frequency Distribution Curves and Other Graphs

Response Time frequency distribution curves (see Clause 5.6.1) must be reported for each transaction type.
The performance curve for response times versus throughput (see Clause 5.6.2) must be reported for the New-Order transaction.
Think Time frequency distribution curves (see Clause 5.6.3) must be reported for each transaction type.
Keying Time frequency distribution curves (see Clause 5.6.4) must be reported for each transaction type.
A graph of throughput versus elapsed time (see Clause 5.6.5) must be reported for the New-Order transaction.

Figure 5.1: Response Times Frequency Distribution for New Order Transactions

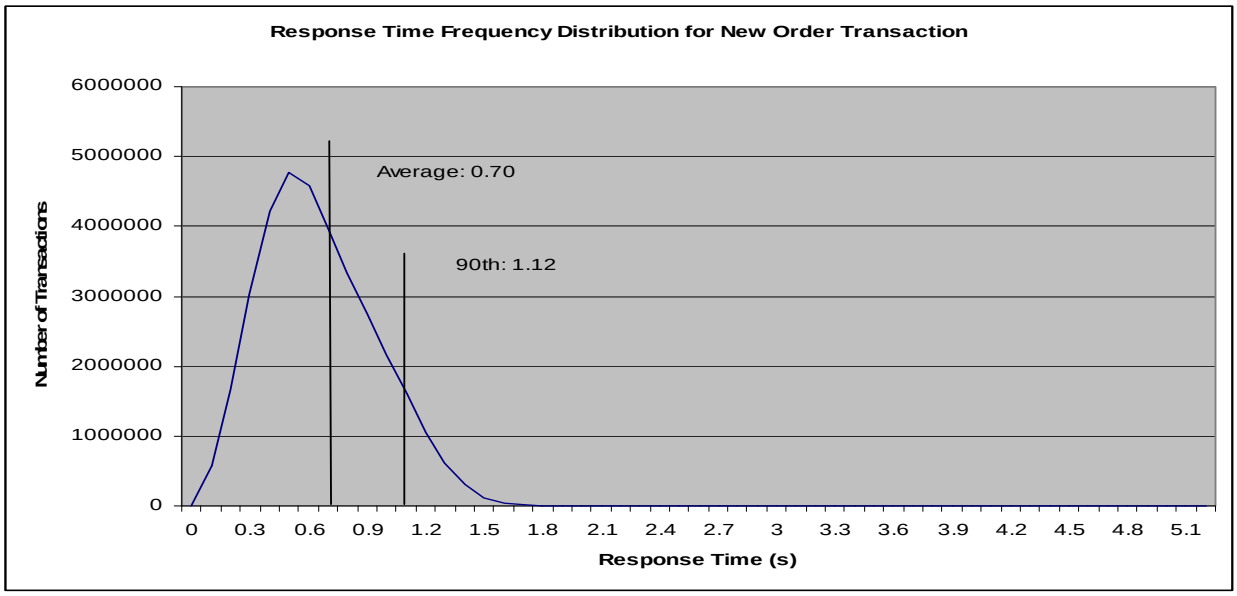

Figure 5.2: Response Times Frequency Distribution for Payment Transactions

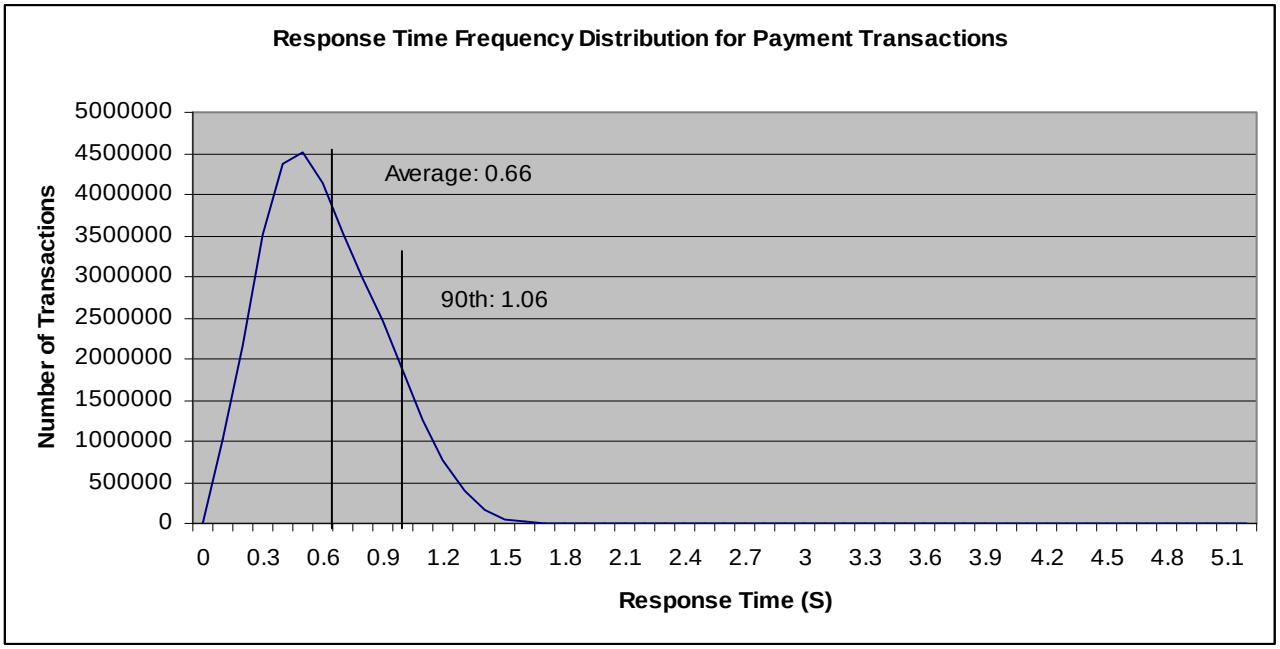

Figure 5.3: Response Times Frequency Distribution for Order Status Transactions

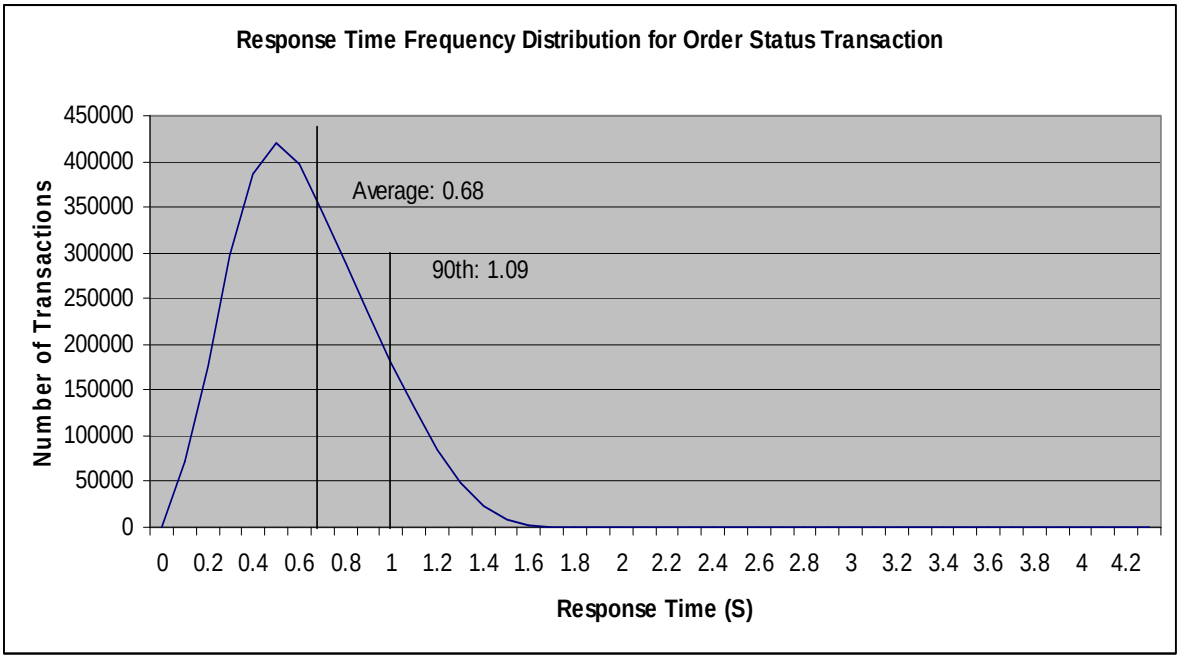

Figure 5.4: Response Times Frequency Distribution for Delivery Transactions

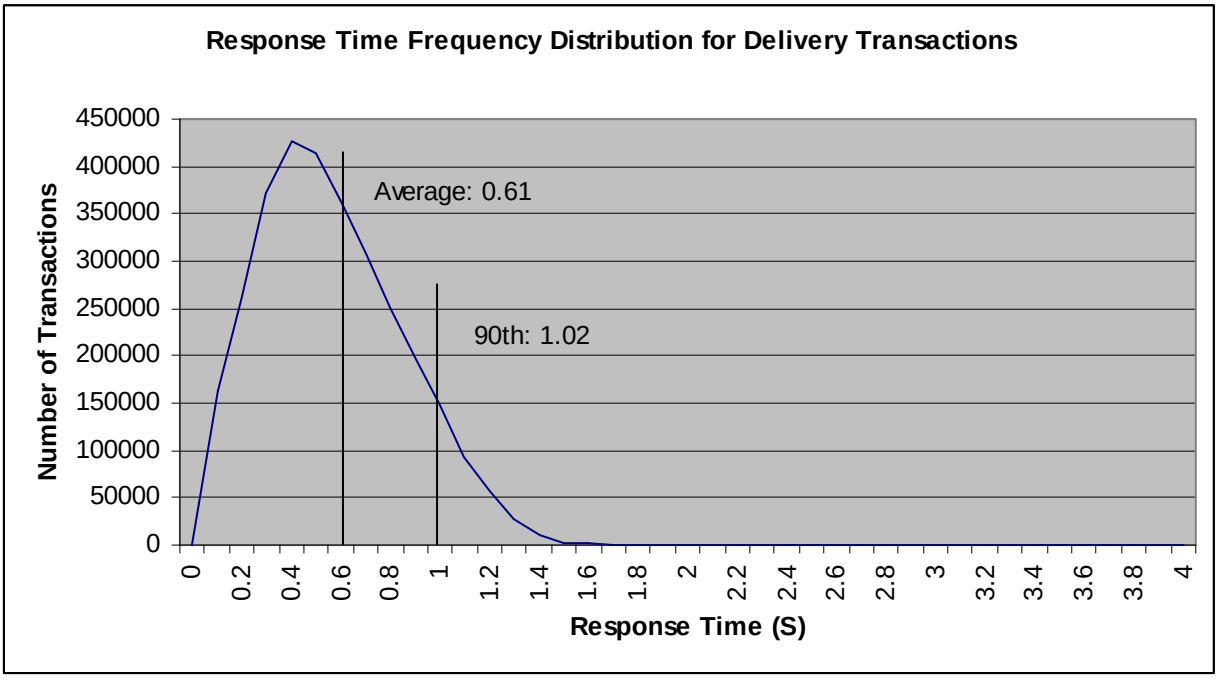

Figure 5.5: Response Times Frequency Distribution for Stock Level Transactions

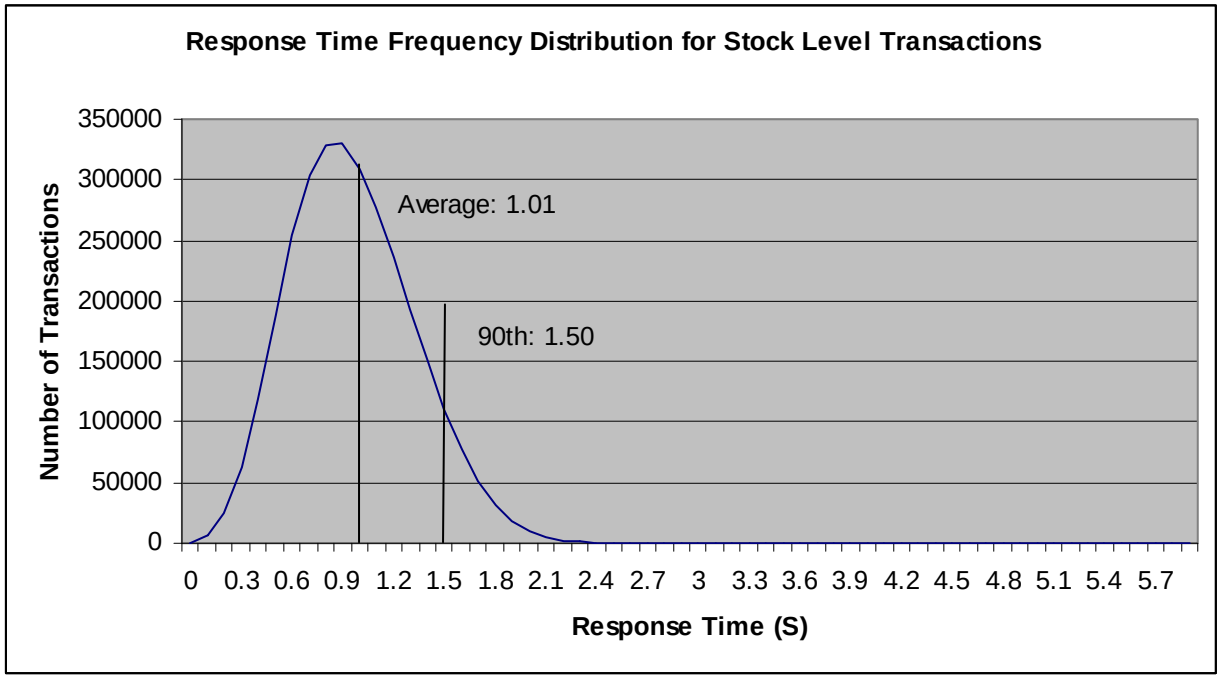

Figure 5.6: Response Time versus Throughput

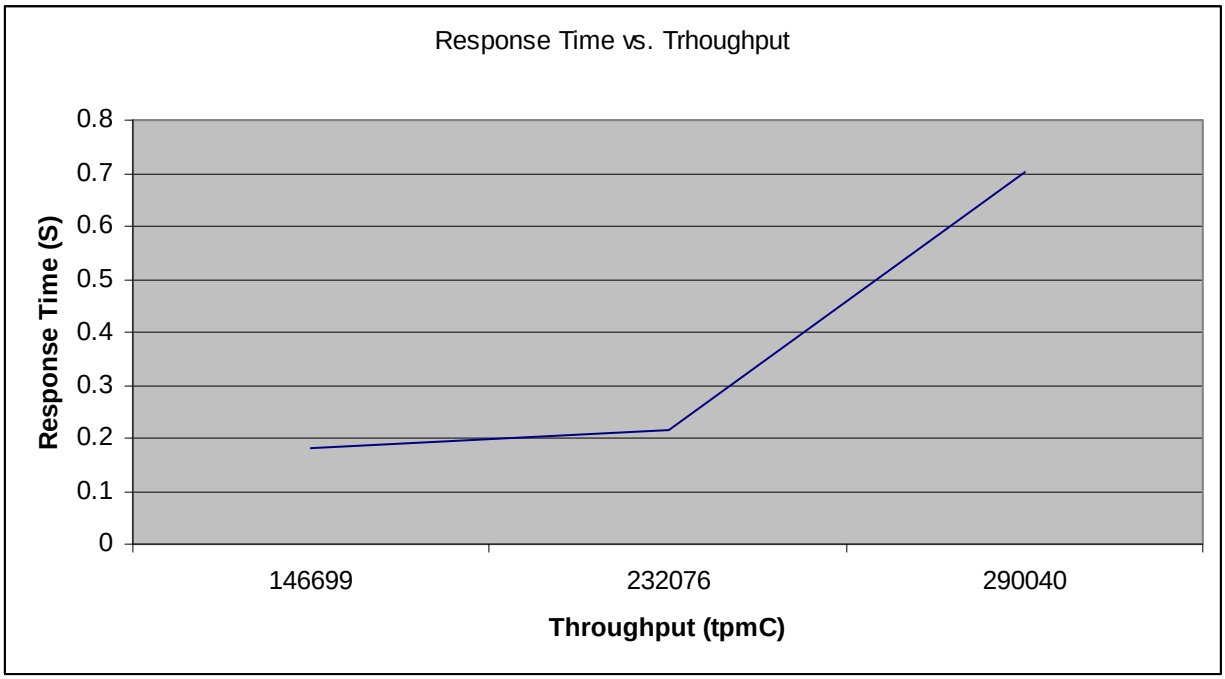

Figure 5.7: Think Times distribution for New Order Transactions

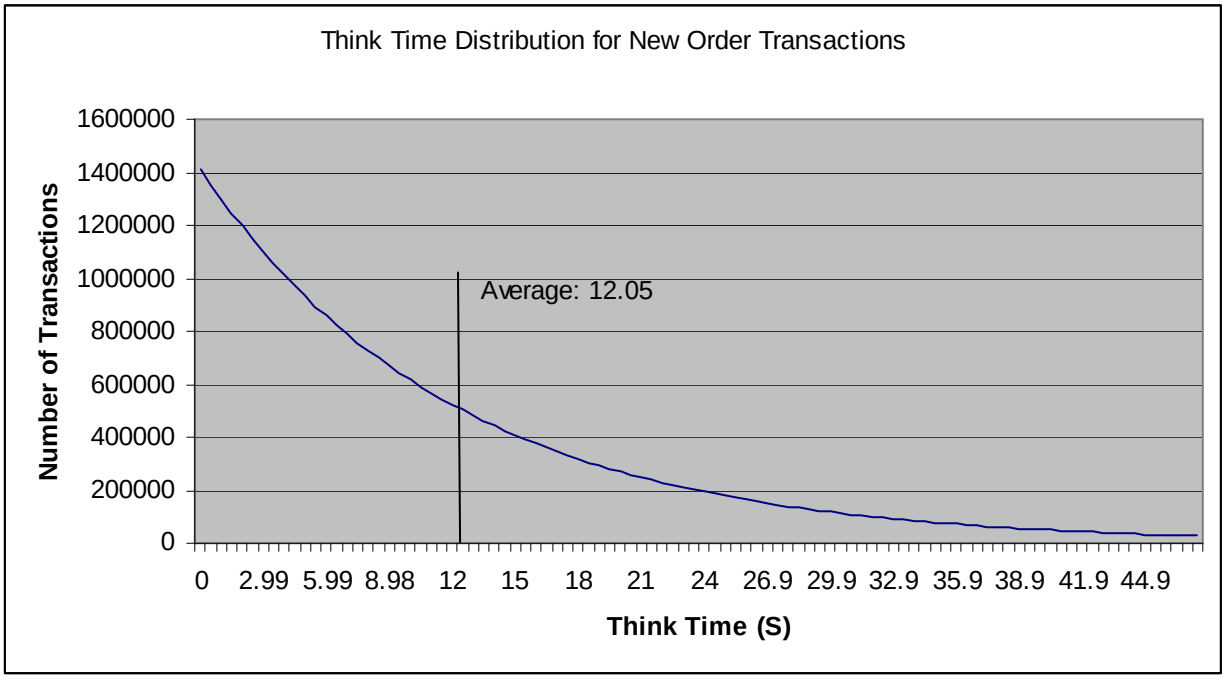

Figure 5.8: Throughput versus Time

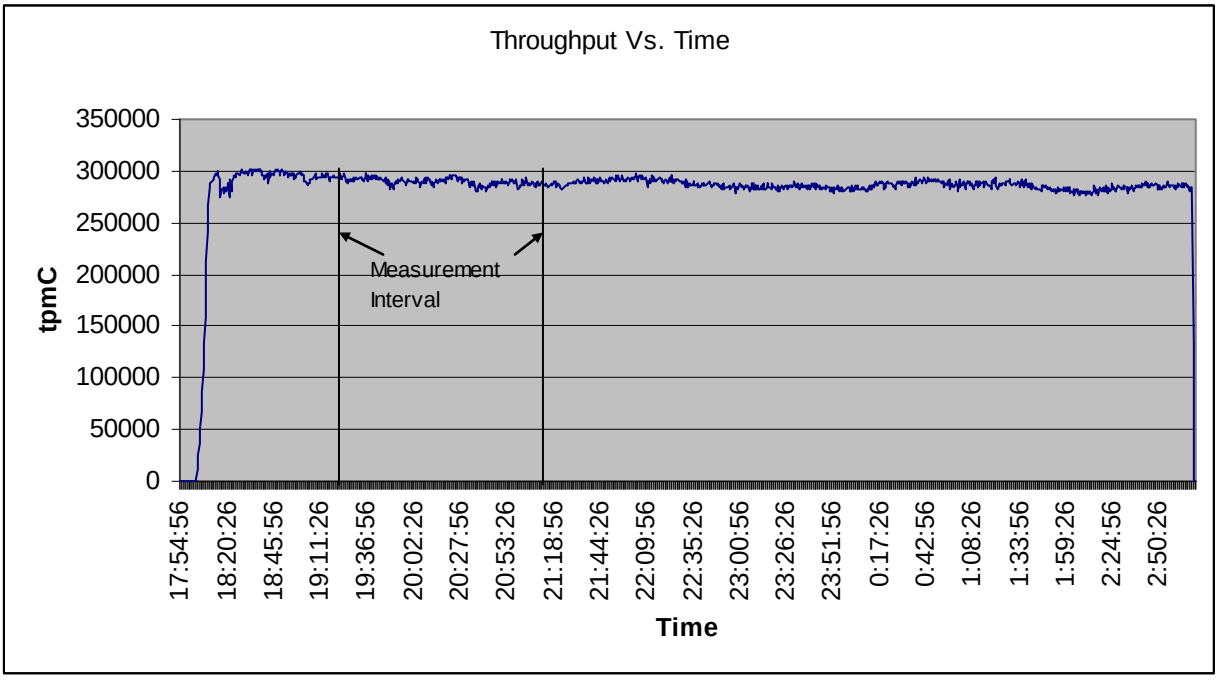

Steady State Determination

The method used to determine that the SUT had reached a steady state prior to commencing the measurement interval must be disclosed.

Steady state was determined using real time monitor utilities from both the operating system and the RTE. Steady state was further confirmed by performing a run for 8 hours. The measurement interval is a part of the 8 hour run. The throughput data collected during the run is graphed in Figure 5.8.

Work Performed During Steady State

A description of how the work normally performed during a sustained test (for example checkpointing, writing redo/undo log records, etc.) actually occurred during the measurement interval must be reported.

For each of the TPC Benchmark C transaction types, the following steps are executed. Each emulated user starts an Internet browser and asks to attach to the application on the desired client. The application formats the menus, input forms and data output using HTML (HyperText Markup Language). The HTML strings are transmitted over TCP/IP back to the client, where they can be displayed by any Web Browser software. The application on the client is run under the control of the Microsoft IIS.

Transactions are submitted by the RTE in accordance with the rules of the TPC-C benchmark. The emulated user chooses a transaction from the menu. The RTE records the time it takes from selecting the menu item to receiving the requested form. Data is generated for input to the form, then the user waits the specified keying time. The submit is sent and the RTE records the time it takes for the transaction to be processed and all the output data to be returned. The user then waits for the randomly generated think time before starting the process over again. All timings taken by the RTE generate a start and end timestamp. Keying and think times are calculated as the difference between end-time of a timing to the start of the next.

The database records transactions in the database tables and the transaction log. Writes to the database may stay in Oracle's in-memory data cache for a while before being written to disk. Checkpoints are initiated once the log files were filled and allowed to roll over.

Measurement Period Duration

A statement of the duration of the measurement interval for the reported Maximum Qualified Throughput (tpmC) must be included.

The reported measured interval was 7200 seconds.

Regulation of Transaction Mix

The method of regulation of the transaction mix (e.g., card decks or weighted random distribution) must be described. If weighted distribution is used and the RTE adjusts the weights associated with each transaction type, the maximum adjustments to the weight from the initial value must be disclosed.

The RTE was given a weighted random distribution, which could not be adjusted during the run.

Transaction Statistics

The percentage of the total mix for each transaction type must be disclosed. The percentage of New-Order transactions rolled back as a result of invalid item number must be disclosed. The average number of order-lines entered per New-Order transaction must be disclosed. The percentage of remote order lines per New-Order transaction must be disclosed. The percentage of remote Payment transactions must be disclosed. The percentage of customer selections by customer last name in the Payment and Order-Status transactions must be disclosed. The percentage of Delivery transactions skipped due to there being fewer than necessary orders in the New-Order table must be disclosed.

Table 5.3: Transaction Statistics

Statistic		Value
New Order	Home warehouse order lines	99.00%
	Remote warehouse order lines	1.00%
	Rolled back transactions	1.00%
	Average items per order	10.00
Payment	Home warehouse	85.01%
	Remote warehouse	14.99%
	Accessed by last name	60.00%
Order Status	Accessed by last name	59.99%
Delivery	Skipped transactions	0
Transaction Mix	New Order	44.996%
	Payment	43.002%
	Order status	4.001%
	Delivery	4.001%
	Stock level	4.001%

Checkpoint

The number of checkpoints in the Measurement Interval, the time in seconds from the start of the Measurement Interval to the first checkpoint, and the Checkpoint Interval must be disclosed.

Oracle database was performed checkpoints at log switches. The database log files were sized such that a log switch would occur approximately every 26 minutes at the desired throughput. Two complete checkpoints occurred during the warm-up period. There were four complete checkpoint occurred during the measurement period, the first of which started 19 minutes and 23 seconds into the measurement interval..

Clause 6 Related Items

RTE Descriptions

If the RTE is commercially available, then its inputs must be specified. Otherwise, a description must be supplied of what inputs (e.g., scripts) to the RTE had been used.

PRTE Software was used to simulate terminal users, generate random data and record response times. This package ran on systems that are distinct from the system under test. PRTE command file used is included in Appendix A.

Emulated Components

It must be demonstrated that the functionality and performance of the components being emulated in the Driver System are equivalent to the priced system. The results of the test described in Clause 6.6.3.4 must be disclosed.

Due to the large number of PCs and associated hardware that would be required to run these tests, Remote Terminal Emulator was used to emulate the connected PCs and LAN. As configured for this test, the driver software emulates the traffic that would be observed from the users ' PCs connected by Ethernet to the front-end clients using HTTP (HyperText Transfer Protocol)over TCP/IP.

The driver system consisted of 10 ProLiant DL580 servers, 1 master RTE and 9 slaves.

Functional Diagrams

A complete functional diagram of both the benchmark configuration and the configuration of the proposed (target) system must be disclosed. A detailed list of all hardware and software functionality being performed on the Driver System and its interface to the SUT must be disclosed.

The diagram in Section 1 shows the tested and priced benchmark configurations.

Networks

The network configuration of both the tested services and proposed (target) services which are being represented and a thorough explanation of exactly which parts of the proposed configuration are being replaced with the Driver System must be disclosed.

The bandwidth of the networks used in the tested/priced configuration must be disclosed.

Section 1 of this report contains detailed diagrams of both the benchmark configuration and the priced configuration. The eight clients are connected to the server via 1000Base T Ethernet switch. The server has 2 connections into the switch, while each client has only 1 connection into the switch.

The drivers systems and client systems were connected using another 1000BaseT Ethernet switch.

Operator Intervention

If the configuration requires operator intervention (see Clause 6.6.6), the mechanism and the frequency of this intervention must be disclosed.

This configuration does not require any operator intervention to sustain eight hours of the reported throughput.

Clause 7 Related Items

System Pricing

A detailed list of hardware and software used in the priced system must be reported. Each separately orderable item must have vendor part number, description, and release/revision level, and either general availability status or committed delivery date. If package-pricing is used, vendor part number of the package and a description uniquely identifying each of the components of the package must be disclosed. Pricing source and effective date(s) of price(s) must also be reported.

The total 3 year price of the entire configuration must be reported, including: hardware, software, and maintenance charges. Separate component pricing is recommended. The basis of all discounts used must be disclosed.

The details of the hardware and software are reported in the front of this report as part of the executive summary. All third party quotations are included at the end of this report as Appendix D.

Availability, Throughput, and Price Performance

The committed delivery date for general availability (availability date) of products used in the price calculation must be reported. When the priced system includes products with different availability dates, the reported availability date for the priced system must be the date at which all components are committed to be available.

A statement of the measured tpmC as well as the respective calculations for the 3-year pricing, price/performance (price/tpmC), and the availability date must be included.

- **Maximum Qualified Throughput 290,040 tpmC**
- **Price per tpmC $0.39 per tpmC**
- **Watts per KtpmC 4.22 watts/KtpmC**
- **Available August 16, 2010**

All components are available now.

Country Specific Pricing

Additional Clause 7 related items may be included in the Full Disclosure Report for each country specific priced configuration. Country specific pricing is subject to Clause 7.1.7

This system is being priced for the United States of America.

Usage Pricing

For any usage pricing, the sponsor must disclose:

- *Usage level at which the component was priced.*
- *A statement of the company policy allowing such pricing.*

The component pricing based on usage is shown below:

- Oracle Database 11g R2 Standard Edition One
- Oracle Enterprise Linux
- Windows Server 2008 R2 Standard Edition

Clause 9 Related Items

Auditor's Report

The auditor's name, address, phone number, and a copy of the auditor's attestation letter indicating compliance must be included in the Full Disclosure Report.

This implementation of the TPC Benchmark C was audited by Lorna Livingtree of Performance Metrics Inc.

Performance Metrics, Inc. P.O. Box 984 Klamath, CA 95538
phone: 707-482-0523 fax: 707-482-0575 email: lornal@perfmetrics.com

August 13, 2010

Mr. Bryon Georgson
Database Performance Engineer
Hewlett-Packard Company
20555 SH 249
Houston, TX 77070

I have verified by remote the TPC Benchmark™ C for the following configuration:
Platform: HP ProLiant ML350 G6

Database Manager: Oracle Database 11g Release 2 Standard Edition

Operating System: Oracle Enterprise Linux

Transaction Monitor: Microsoft COM+

System Under Test:				
CPU's	Memory	Disks (total)	90% Response	TpmC
1 Intel Xeon 6 core @ 2.67 Ghz	Main: 96 GB	24 @ 120 GB SSD 24 @ 500 GB 1 @ 72 GB (OS)	1.11	**290,040**
Clients: 3 ML150 G6				
1 Intel quad core	2 GB	1 @ 250 GB	NA	**NA**

@ 2.13 Ghz				

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark. The following attributes of the benchmark were given special attention:

- The transactions were correctly implemented.
- The database files were properly sized.
- The database was properly scaled with 24,000 warehouses, all of which were active during the measured interval.
- The ACID properties were successfully demonstrated
- Input data was generated according to the specified percentages.
- Eight hours of mirrored log space was present on the tested system.
- Eight hours of growth space for the dynamic tables was present on the tested system.
- The data for the 60 days space calculation was verified.
- The steady state portion of the test was 120 minutes.
- There was one complete checkpoint in steady state before the measured interval.
- There were 4 checkpoints started and completed inside the measured interval.
- The system pricing was checked for major components and maintenance.
- Third party quotes were verified for compliance.

Auditor Notes: None.

Sincerely,

Lorna Livingtree

/*#ifdef HISTORY

  02-Jun-97 WCarr Removed use of Mutex objects in favor of critical
       sections.  These prove to be at least one order of
       magnitude faster.

  31-Oct-97 WCarr Fixed a buffer wrap problem where if the data
were
       to end exactly on the buffer end, the code would
       not wrap to the beginning.

       Also added code that causes a writer to block if
       there is no room to write in data.  Fixed the
       timeout code so that a non-blocking read or write
       can function.

  06-Nov-97 WCarr Modified APIs to allow the read and write
operaions
       to supply the timeout values.

       Fixed a bug where the critical section was not
       released when a buffer read or write operation
       timed out.

/*  ------------------------------------------------------------
---------------
    The following defines the form layout of the different screens
(forms).

    NAME=1 - Command.

     VALUE = NewOrder      - neworder bring out new order input
form
             Delivery      - delivery bring out delivery input form
             OrderStatus   - order status bring out order status
input form
             Payment       - payment bring out payment input form
```

```
            StockLevel    - stock level bring out stock level
input form
            Menu          - display main menu
            Process       - perform the specified transaction
after providing input
            Begin         - send wid and did

    NAME=2 - Form Type.

      VALUE = d,n,p,s,o [D,N,P,S,O] output/input. Plus terminal ID.
            = W logon
            = M main menu

    Delivery
        3 - district number.

    Order Status
        3 - district number.
        4 - customer id.
        5 - customer last name.

    Payment
        3 - district number.
        4 - customer id.
        5 - customer warehouse.
        6 - customer district.
        7 - name
        8 - amount paid

    Stock Level
        3 - stock level threshould

    New Order
        3 - district number.
        4 - customer number.

Appendix C: Tunable Parameters

SEQUENCE OF EVENTS FOR PERFORMANCE RUN

1. Boot up systems clients, servers, & RTEs).
2. Startup the Oracle listener
3. Startup the database on the server using start.sh script.
4. Set priorities and bind interrupts/processe to processors using setrrpri.sh script.
5. Start the RTE.
6. Adjust RTE throttle.

#Where:
#<domain> can be:
#        - an user name
#        - a group name, with @group syntax
#        - the wildcard *, for default entry
#        - the wildcard %, can be also used with %group syntax,
#                 for maxlogin limit
#
#<type> can have the two values:
#        - "soft" for enforcing the soft limits
#        - "hard" for enforcing hard limits
#
#<item> can be one of the following:
#        - core - limits the core file size (KB)
#        - data - max data size (KB)
#        - fsize - maximum filesize (KB)
#        - memlock - max locked-in-memory address space (KB)
#        - nofile - max number of open files
#        - rss - max resident set size (KB)
#        - stack - max stack size (KB)
#        - cpu - max CPU time (MIN)
#        - nproc - max number of processes
#        - as - address space limit
#        - maxlogins - max number of logins for this user
#        - maxsyslogins - max number of logins on the system
#        - priority - the priority to run user process with
#        - locks - max number of file locks the user can hold
#        - sigpending - max number of pending signals
#        - msgqueue - max memory used by POSIX message queues
(bytes)
#        - nice - max nice priority allowed to raise to
#        - rtprio - max realtime priority
#
#<domain>      <type>  <item>         <value>
#

#################################
#
# TPCC_USER_LOG_TYPE controls what information the prte users log
to thier
#                   respective files. This is a bit mask.
#
#                   0 - no logging
#                   1 - timer logging (required for asci data
reduction)
#                   2 - sut data logging (required for durability)
#                   4 - script logging (required by the tpcc user
script)
#                   8 - user sut data logging (required by web
users for
#                       error checking)
#
#                   In general, leave this at 12 for web clients
doing binary
#                   data reduction, and 13 for web clients doing
asci data
#                   reduction.
#
# TPCC_USER_FLUSH_LOG is whether or not to flush every write to the
log.
#
# DURABILITY_LOGGING is whether or not to parse new order response
pages for
#                   durability data (to be sent to reducer). This
variable
#        is a boolean so legal values are 0,f,F and 1,t,T.
#
# C_LAST  is the constant value used for customer last names.
#   This value must be chosen with care.  It must be based on
#   the value you used when populating your database.

#                                   #
#####################################
#
# LOOPBACK_MODE
#   0 - Full end-to-end runs.
#   1 - Back end loopback runs (not implemented yet)
#   2 - Front end loopback runs
#   3 - RTE loopback runs
#
# RUN_NUMBER          is used to tag all output files with the run
number.
#
#                 1 - the primary measurement run.
#                 2 - the repeatability run.
#                 5 - the 50% run.
#                 8 - the 80% run.
#
#                     If you are unsure which run this really will
end up being,
#                     just leave it at 1, and you can rename files
later if you
#                     need to.
#
# VERSION_NUMBER      is used to tag all output files with the
version number.
#                     This is used if you submit files to the
auditor, and then
#                     need to rerun the test, and resubmit files to
the auditor,
#                     for some reason.  For example, you submit a
repeatability
#                     run (RUN_NUMBER 2, VERSION_NUMBER 1) and the
auditor finds
#                     a problem and asks you to re-run the test
(RUN_NUMBER 1,
#                     VERSION_NUMBER 2).
#                     Under normal circumstances, this can just be
left at 1.
#
# TEST_RESULTS_DIR    is the full directory path where the test's
run directory
#                     will be created.  All files (data, log, etc)
will be
#                     put into the run directory.
#
# WARMUP_TIME         is the time in seconds to warm up.  This is
the period
#                     of time after all users have started doing
transactions
#                     and before the measurement interval begins.
#
# STEADY_STATE_TIME is the time for which the test is considered to
be
#     in a steady running state.  It is during this time
#     that all data for measurement intervals will be
#     collected.
#
# MEASUREMENT_INTERVAL  defines the length of a test period within
the
#     STEADY_STATE_TIME. The steady state time may have 1
#     or more measurement intervals. Each measurement
#     interval can be thought of as a seperate measurement
#     run.
#
# COOLDOWN_TIME       is the length of time the test will continue
to run
#                     after the measurement interval is over.  This
time can
#                     be used for doing various types of data
collection by
#                     hand if desired that might otherwise have a
negative
#                     impact on the measured test results. Even if
you are
#                     not collecting any extra data by hand, it is
recommended
#                     that you keep this value at something like
300 or 600
#                     to avoid "clipping" effects at the end of the
measurement
#                     interval.
#
# CHECKPOINT_INTERVAL is the total time between the start of each
#     checkpoint command.
#
# CKPT_PROXIMITY_ADDITIONAL_OFFSET  This value will be added to any
#     required proximity time to give the actual start
#     time of the first checkpoint in the measurement
#     interval.
#
# LOGIN_DELAY         is the delay between logins on a per front
end basis.
#                     NOTE: This is similar to the prte internal
variable
#                     resume_interval (tpcc users start, then
immediately
#                     pause, so the act of logging in is just a
resume) but
#                     not exactly the same.
#
# RESUME_DELAY        is the delay between resumes on a per front
end basis.
#                     NOTE: This is similar to the prte internal
variable
#                     resume_interval but not exactly the same.
#
# STOP_DELAY          is the delay between stops on a per front end
basis.
#                     NOTE: This is similar to the prte internal
variable
#                     stop_interval but not exactly the same.
#
# SYNC_OFFSET   how many users we'll allow to have outstanding
#     when doing crowd control.
#
# SYNC_UPDATE   how often user login/resume/stop progress is
printed
#     out to the console (heartbeat of user synchronization
#     effectively).
#
# MSG_TIMEOUT   how long we'll wait for status and sync messages.
#

####
#
# AUDIT UTILITIES -- these are the replacement for the audit
# shell scripts -- they currently only work for Oracle on DUNIX.
# They do the following:
#     Collect logspace info
#     Write data to audit table for later use in runcheck
#     Collect checkpoint info
#     Run optional custom scripts on back-end before or after the
test
#     For Oracle, collect bstat/estat (optional)
#
#####################################################################
####
#
# GET_ALL_AUDIT_FILES if True (or 1) will create the following:
#     Audit table for doing runcheck later
#     m1log.v1 -- a before & after snapshot of the logsize
#
# BE_NAMES           Comma-separated list of back-ends
#
# BE_USERNAME        Username to use when logging into back-ends
#                    NOTE: you must have .rhosts configured so no
password
#                    is needed.
#
# DATABASE_TYPE      Oracle, Sybase or MsSql
#
# DATABASE_USERNAME  Username and password for database.
# DATABASE_PASSWORD  Defaults are: tpcc/tpcc for Oracle and sa/<no-
passwd>
#                    for Sybase and MsSql
#
# Optional variables -- if you don't want them, comment them out or
set to ""
#
# ORACLE_STATS_SCRIPT_PATH
#                    Path to directory on back-end containing
Oracle's
#                    orst_<xxx>.sql files.
#                    For example: $ORACLE_HOME/bench/gen/sql
#
# CUSTOM_BEFORE_TEST_SCRIPT
# CUSTOM_AFTER_TEST_SCRIPT
#                    Path of executable file on back-end to be run
before/after
#                    the test.  For example, if you wanted to run
processor
#                    affinity and load some stored procedures
before a test,
#                    you could put the commands in a shell script
on the BE
#                    and call put the path to that shell script
into the

Here is the information you requested regarding pricing for several Microsoft products to be used in conjunction with your TPC benchmark testing.

All pricing shown is in US Dollars ($).

Part Number	Description	Unit Price	Quantity	Price
P73-03883	**Windows Server 2008 R2 Standard Edition** *Server License with 5 CALs* *No Discounts Applied*	$1,029	3	$3,087
127-00012	**Visual Studio Standard 2005** *Full License* *No Discount Applied*	$250	1	$250
N/A	**Microsoft Problem Resolution Services** *Professional Support* *(1 Incident)*	$245	1	$245

A list of Microsoft's resellers can be found at
http://www.microsoft.com/products/info/render.aspx?view=22&type=mnp&content=22/licensing

All products listed above are currently orderable and available.

Defect support is included in the purchase price. Additional support is available from Microsoft PSS on an incident by incident basis at $245 per call.

This quote is valid for the next 90 days.

Reference ID: PCbyge1008040000000997.

Description

Now you can have a powerful, high-speed network on a small scale. NETGEAR's GS108 Gigabit Ethernet Switch lets you build a system that provides a full, dedicated 1000, 100, or 10 Mbps connection so you can move very large files across your network instantly. The GS108 also lets you painlessly integrate 10, 100, and 1000 Mbps devices. This potent switch is packed with ease-of-use features to simplify your workday experience. Its compact design fits neatly into small work spaces and, since it's self-cooling without a fan, it runs silently and unobtrusively.

Specifications

Manufacturer	NETGEAR
Manufacturer Part #	GS108NA
Product Description	Ga108 8port 10/100/1000 Switch
Device Type	Switch
Form Factor	External
Approximate Dimensions (WxDxH)	3.7 in x 4 in x 1.1 in
Approximate Weight	9.9 oz
Localization	North America
Ports Qty	8 x Ethernet 10Base-T, Ethernet 100Base-TX, Ethernet 1000Base-T
Data Transfer Rate	1 Gbps
Data Link Protocol	Ethernet, Fast Ethernet, Gigabit Ethernet
Communication Mode	Half-duplex, full-duplex
Features	Full duplex capability, auto-sensing per device, auto-uplink (auto MDI/MDI-X), store and forward
Compliant Standards	IEEE 802.3u, IEEE 802.3i, IEEE 802.3wb, IEEE 802.1p
Manufacturer Warranty	Limited lifetime warranty

Limit two per customer. To view terms and conditions, and to submit your rebate, please visit us at www.mcsatherebates.com and reference promotional code 08-62381. All rebate submissions must be postmarked within 30 days of purchase date.

Appendix F:TPC-Energy Disclosure Report

A.1. TPC-Energy Clause 2-related items (Methodology)

A.1.1. Minimum abient temperature
The minimum abient temperature must be disclosed.

Minimum temperature reported by EMSC = 20.88 C

A.1.2. External electric power source characteristics
The characteristics of the external electric power source must be disclosed. In particular, the voltage, frequency in Hertz, and phase information must be reported.

The external electric power source has the following characteristics: 208V, 60Hz, and single phase.

A.1.3. Air-pressure alterations
A statement is required that assures that nothing was done to alter the air-pressure in the measurement environment.

Nothing was done to alter the air-pressure in the measurement environment.

A.1.4. Temperature measurement
A description of where the temperature was measured and how it was determined that this was representative of the lowest ambient temperature is required.

Temperature was measured at the SUT air inlet and the air conditioning returns blow cold air at SUT air inlet.

A.1.5. Cooling method
If a method of cooling other than circulation of ambient air is employed in the REC, a statement describing this method must be included.

No other method of cooling was used.

A.1.6. PTD license
To be compliant with licenses associated with EMS, the following statement must be included in every FDR which contains a TPC-Energy Metric:

The power and temperature characteristics of the MEC were measure using TPC's Energy Measurement Software (EMS). This includes the EMS-PTD, a modified version of the SPEC PTDaemon, which is provided under license from the Standard Performance Evaluation Corporation (SPEC).

A.2. TPC-Energy Clause 3-related items (Metrics)

A.2.1. Primary Metric
The normalized work derived from the Performance Metric (as described in Clause 3.2.1) must be disclosed.

4.22 watts / KtpmC

The computation for total energy used for each measurement segment that contributes to a Performance Metric must be disclosed. If the energy of the entire Priced Configuration is not derived from direct measurements, the methods for deriving the energy for components that were not measured must be disclosed (See Clause 7.3.3.4).

			Full Load Energy									
PMU	Full Load Average Watts Reading	% of Reading Uncertainty	Watts Reading Correction	Wattage Range Setting	% of Range Uncertainty	Wattage Range Correction	Total Wattage Correction	Accuarcy Correction Factor	Reported Watt - Seconds	Adjusted Watt - Seconds	Reported Seconds	Adjusted Average Watts
SUT PMU-1	745.92	0.10%	+0.75	1500	0.10%	+1.50	+2.25	0.30%	5,371,385	5,387,558	7,200	748.27
SUT PMU-2	361.75	0.10%	+0.36	1500	0.10%	+1.50	+1.86	0.51%	2,604,993	2,618,400	7,200	363.67
4 x Monitor NamePlate	112	0.00%	+0.00	0	0.00%	+0.00	+0.00	0.00%	806,400	806,400	7,200	112.00
REC Total	1219.67								8,782,778	8,812,358		1223.94

All monitors power consumption in the measurement were calculated using nameplate values.

The duration of each measurement that produces a Performance Metric must be disclosed.

The duration for the measured runs were 120 minutes. The duration for the idle measurements were 10 minutes.

The average power requirement for each measurement that produces one of thes metrics.

TPC-C measurement interval and idle average power requirements:

	Watts / KtpmC	Full Load Avg Watts	Full Load % of REC	Full Load Watt Mins.	Idle Avg. Watts	Idle % of REC
SUT PMU-1	2.57	745.92	60.9%	89,523	694.33	60.8%
SUT PMU-2	1.25	361.75	29.6%	43,417	329.43	28.9%
Total REC	4.22	1224	100%	146873	1141	100%

The TPC-Energy Primary Metric must be disclosed, including the calculation that is used to derive it.

Total REC Energy Consumption = 146,873 Watt-minutes
SUT Total work = 34,804,800 transactions

146,873 Watt-minutes / 34,804,800 transactions = 0.00422 Watts / tpmC
0.00422 Watts / tpmC * 1000 = 4.22 watts / KtpmC

A.2.2. Secondary Metrics At Reported Performance

If the TPC-Energy Secondary Metrics are reported, the components of the REC that are included in each subsystem must be identified. This can be achieved with separate lists to be included in the FDR or with a specific designation in the price spreadsheet. Every component in the REC that consumes energy must be included in exactly one subsystem.

No TPC-Energy Secondary Metrics are being reported.

A.2.3. Idle Power reporting

The Idle Power measurement / calclulation for thee REC must be reported as numerical quantities.

The Idle Power measurement for REC = 1,141

If TPC-Energy Secondary Metrics are reported, then the Idle Power measurement / calculation for each subsystem must also be reported as numerical quantities.

No TPC-Energy Secondary Metrics are being reported.

The length of time between the conclusion of the performance measurement and the start of the idle measurement must be reported.
The Idle measurement began 20 minutes after the conclusion of the performance measurement.

The duration of the idle measurement must be reported.

The Idle measurement duration was 10 minutes.

A statement is required that assures that the system is in a state that is ready to run the Application(s) of the benchmark for the duration of the idle measurement.

The system is in a state that is ready to run the Application(s) of the benchmark for the duration of the idle measurement. This was verified by executing a single transaction after the idle measurement period was completed. The transaction time of this single transaction was compared to the 90th percentile and found to meet the required specifications.

A.2.4. Disclosure requirements when only part of the REC is measured for power.

If all PMU's of the REC are not measured for energy use, the FDR must include a description of which PMUs of REC were measure with a power analyzer. The FDR must disclose which PMUs of the REC were computed based on the energy measurements of similar PMUs. A diagram must be included that identifies the portions of the configuration which were measured for energy use and which were calculated. This diagram may be combined with other diagrams required by the TPC Benchmark Standard.

- *The method used to determing which PMUs were measured must be disclosed.*
- *The power values for the each partial-REC measurement for duration of the performance and idle measurements must be disclosed.*
- *The calculation for the power requirements of the entire REC and, if applicable, each subsystem must be disclosed.*

			Full Load Energy									
PMU	Full Load Average Watts Reading	% of Reading Uncertainty	Watts Reading Correction	Wattage Range Setting	% of Range Uncertainty	Wattage Range Correction	Total Wattage Correction	Accuarcy Correction Factor	Reported Watt - Seconds	Adjusted Watt - Seconds	Reported Seconds	Adjusted Average Watts
SUT PMU-1	745.92	0.10%	+0.75	1500	0.10%	+1.50	+2.25	0.30%	5,371,385	5,387,558	7,200	748.27
SUT PMU-2	361.75	0.10%	+0.36	1500	0.10%	+1.50	+1.86	0.51%	2,604,993	2,618,400	7,200	363.67
4 x Monitor NamePlate	112	0.00%	+0.00	0	0.00%	+0.00	+0.00	0.00%	806,400	806,400	7,200	112.00
REC Total	**1219.67**								**8,782,778**	**8,812,358**		**1223.94**

			Idle Load Energy									
PMU	Idle Average Watts Reading	% of Reading Uncertainty	Watts Reading Correction	Wattage Range Setting	% of Range Uncertainty	Wattage Range Correction	Total Wattage Correction	Accuarcy Correction Factor	Reported Watt / Seconds	Adjusted Watt / Seconds	Reported Seconds	Adjusted Average Watts
SUT PMU-1	694.33	0.10%	+0.69	1500	0.10%	+1.50	+2.19	0.32%	417,290	418,608	600	697.68
SUT PMU-2	329.43	0.10%	+0.33	1500	0.10%	+1.50	+1.83	0.56%	197,985	199,084	600	331.81
4 x Monitor NamePlate	112	0.00%	+0.00	0	0.00%	+0.00	+0.00	0.00%	67,200	67,200	600	112.00
REC Total	**1135.76**								**682,475**	**684893**		**1141.49**

The four monitors power consumption were calculated using the nameplate values. All the rest of the PMUs are measured in the charts above.

A.2.5. Disclosure requirements when component substitution is used.

If the TPC Benchmark Standard allows the Priced Configuration to differ from the Measured Configuration, the methods used to assign energy or power characteristics to the substitute components must be disclosed.
The method use to determine which PMUs were measured must be disclosed.
The power values for the each partial-REC measurement for dureation of the performance and idle measurements must be disclosed

.
There were no component substitutions.

A.3. TPC-Energy Clause 4-related items (Drivers/Controller0

A statement indicating the version of EMS used must be included in the FDR, including a statement that no alterations of this code swere made for the benchmark, except as specified by Clause 7.3.4.3. This includes levels for the EMS-PTD Manager, EMS-PTD and EMS-controller.

The EMS version used was 1.1.1 and no alterations were made.

Input paramters for the EMS software must be disclosed.

The following EMS script was used to configure the EMS software

```
start log power-perfrun > DBServer+Storage
sleep 5
start log pwer-perfrun-clients > clients
sleep 5
start log temperature-perfrun > TempML350G6
sleep 5
time sync
sleep 5
set sample 1000 > DBServer+Storage
sleep 5
set sample 1000 > clients
sleep 5
set sample 10000 > REC-DBServerTempML350G6
sleep 5
start data “run 1”
```

Any changes in the EMS components must be documented. Documentation must include a description of the issue, the reason the change was necessary for disclosure of the Result, and the changes made to resolve it. Any change to the TPC-Provided Code must be included with the submission as a Supporting File.

No changes to EMS components were made.

A.4. TPC-Energy Clause 6-related items (Instrumentation)

A.4.1. Power Analyzer Information

			Power Analyzer Specifications and Settings						
PMU	Make	Model	Serial Number	Calibration Date	Wattage Range Setting	Voltage Range Setting	Current Range Setting	% of reading	% of Range
SUT PMU-1	Yokogawa	WT210	91k208942	3/19/2010	1500	300	5	0.10%	0.10%
SUT PMU-2	Yokogawa	WT210	91GB45372	12/10/2009	1500	300	5	0.10%	0.10%
4 x Monitor NamePlate	N/A								

A.4.2. Temperature Sensor Information

Make and model.
Acccuracy and the source of information.

Digi Watchport/H Temperature probe.

Temperature accuracy from Manufacturers Datasheet:
+/- 3.6º F (+/- 2º C) at -40º F to 14º F (-40º C to -10º C)
+/- 0.9º F (+/- 0.5º C) at -14º F to 185º F (-10º C to -85º C)

\

A.5. TPC-Energy Clause 8-related items.

A.5.1 Auditor's attestation letter.

August 13, 2010

Mr. Bryon Georgson
Database Performance Engineer
Hewlett-Packard Company
20555 SH 249
Houston, TX 77070

I have verified by remote the TPC Benchmark™ C for the following configuration:
Platform: HP ProLiant ML350 G6
Database Manager: Oracle Database 11g Release 2 Standard Edition
Operating System: Oracle Enterprise Linux
Transaction Monitor: Microsoft COM+

System Under Test:				
CPU's	Memory	Disks (total)	90% Response	TpmC
1 Intel Xeon 6 core @ 2.67 Ghz	Main: 96 GB	24 @ 120 GB SSD 24 @ 500 GB 1 @ 72 GB (OS)	1.11	**290,040**
Clients: 3 ML150 G6				
1 Intel quad core @ 2.13 Ghz	2 GB	1 @ 250 GB	NA	**NA**

In addition to the performance metric, the energy consumption was measured during the performance runs in compliance with the TPC-Energy specification.

- The power analyzers used were verified to be approved and calibrated within one year prior to this measurement.

- The energy measurements met all requirements of the specification unless an exception is noted below.
- The calculations for the TPC-Energy Primary Metric were verified as completed correctly.
- The EMS software was verified to be the correct version and without any changes.
- The executive summary page and the FDR were verified for accuracy.

Auditor's Notes: None

Sincerely,

Lorna Livingtree
