Abstract

This document contains the methodology and results of the TPC Benchmark[™] DS (TPC-DS) test conducted in conformance with the requirements of the TPC-DS Standard Specification, Revision 3.2.0.

The test was conducted at a Scale Factor of 10000GB with 8 Tencent Cloud TDSQL Cluster Node T0-CI81X-100GS running Tencent TDSQL v10.3 Enterprise Pro Edition (PostgreSQL v5.21.18) on TencentOS Server 3.2.

Preface

TPC Benchmark[™] DS Overview

The TPC Benchmark[™] DS (TPC-DS) is a decision support benchmark that models several generally applicable aspects of a decision support system, including queries and data maintenance. The benchmark provides are presentative evaluation of performance as a general purpose decision support system.

This benchmark illustrates decision support systems that:

- Examine large volumes of data;
- Give answers to real-world business questions;
- Execute queries of various operational requirements and complexities (e.g., ad-hoc, reporting, iterative OLAP, data mining);
- Are characterized by high CPU and IO load;
- Are periodically synchronized with source OLTP databases through database maintenance functions.
- Run on "Big Data" solutions, such as RDBMS as well as Hadoop/Spark based systems.

A benchmark result measures query response time in single user mode, query throughput in multi user mode and data maintenance performance for a given hardware, operating system, and data processing system configuration under a controlled, complex, multi-user decision support workload.

The purpose of TPC benchmarks is to provide relevant, objective performance data to industry users. To achieve that purpose, TPC benchmark specifications require benchmark tests be implemented with systems, products, technologies and pricing that:

- a) Are generally available to users;
- b) Are relevant to the market segment that the individual TPC benchmark models or represents (e.g., TPC-DS models and represents complex, high data volume, decision support environments);
- c) Would plausibly be implemented by a significant number of users in the market segment modeled or represented by the benchmark.

In keeping with these requirements, the TPC-DS database must be implemented using commercially available data processing software, and its queries must be executed via SQL interface. The use of new systems, products, technologies (hardware or software) and pricing is encouraged so long as they meet the requirements above. Specifically prohibited are benchmark systems, products, technologies or pricing (hereafter referred to as "implementations") whose primary purpose is performance optimization of TPC benchmark results without any corresponding applicability to real-world applications and environments. In other words, all "benchmark special" implementations, which improve benchmark results but not real-world performance or pricing, are prohibited.

TPC benchmark results are expected to be accurate representations of system performance. Therefore, there are specific guidelines that are expected to be followed when measuring those results. The approach or methodology to be used in the measurements are either explicitly described in the specification or left to the discretion of the test sponsor.

When not described in the specification, the methodologies and approaches used must meet the following requirements:

- The approach is an accepted engineering practice or standard;
- The approach does not enhance the result;
- Equipment used in measuring the results is calibrated according to established quality standards;
- Fidelity and candor is maintained in reporting any anomalies in the results, even if not specified in the benchmark requirements.

Further information is available at http://www.tpc.org/

General Items

0.1 Test Sponsor

A statement identifying the benchmark sponsor(s) and other participating companies must be provided.

This benchmark was sponsored by Tencent Cloud Computing Ltd.

0.2 Parameter Settings

Settings must be provided for all customer-tunable parameters and options which have been changed from the defaults found in actual products, including by not limited to:

- Database Tuning Options
- Optimizer/Query execution options
- Query processing tool/language configuration parameters
- Recovery/commit options
- Consistency/locking options
- Operating system and configuration parameters
- Configuration parameters and options for any other software component incorporated into the pricing structure
- Compiler optimization options

This requirement can be satisfied by providing a full list of all parameters and options, as long as all those which have been modified from their default values have been clearly identified and these parameters and options are only set once.

The Supporting File Archive (Clause 8) contains the Operating System and DBMS parameters used in this benchmark.

0.3 Configuration Diagrams

Diagrams of both measured and priced configurations must be provided, accompanied by a description of the differences. This includes, but is not limited to:

- Number and type of processors
- Size of allocated memory, and any specific mapping/partitioning of memory unique to the test. Number and type of disk units (and controllers, if applicable).
- Number of channels or bus connections to disk units, including their protocol type.
- Number of LAN (e.g. Ethernet) Connections, including routers, workstations, terminals, etc., that were physically used in the test or are incorporated into the pricing structure.
- Type and the run-time execution location of software components (e.g., DBMS, query processing tools/languages, middle-ware components, software drivers, etc.).

Measured Configuration

The measured configuration consisted of 8 Nodes:

Node details (8 nodes):

- T0-CI81X-100GS
- Processors/Cores/Threads: 112 vCPU
- Processor Model: Intel Emerald Rapids(-/3.0GHz)
- Memory: 1,024 GB
- Storage:
 - 2 x 960 GB SATA Disk (system disk)
 - 16 x 7.68 TB NVMe SSD Disk (data disk)
- Network: Silver Fir Intelligent NIC Speed: 100 Gbps

System Components Configuration

	1	2	3	4	5	6	7	8
Coordinator	cn001	cn002						
Datanode	dn001- dn016	dn017- dn032	dn033- dn048	dn049- dn064	dn065- dn080	dn081- dn096	dn097- dn112	dn113- dn128

Priced Configuration

There are no differences between the priced and measured configurations.

Clause 2: Logical Database Design Related Items

2.1 Database Definition Statements

Listings must be provided for the DDL scripts and must include all table definition statements and all other statements used to set up the test and qualification databases.

The Supporting File Archive contains the table definitions and all other statements used to set up the test and qualification databases.

2.2 Physical Organization

The physical organization of tables and indices within the test and qualification databases must be disclosed. If the column ordering of any table is different from that specified in Clause2.3 or 2.4, it must be noted.

Horizontal partitioning is used as described.

2.3 Horizontal Partitioning

If any directives to DDLs are used to horizontally partition tables and rows in the test and qualification databases, these directives, DDLs, and other details necessary to replicate the partitioning behavior must be disclosed.

All tables are partitioned. The partition columns for the tables are: customer: c_customer_sk customer_address: ca_address_sk customer_demographics: cd_demo_sk catalog_sales: cs_item_sk, cs_sold_date_sk catalog_returns: cr_item_sk, cr_returned_date_sk inventory: inv_item_sk, inv_date_sk store_returns: sr_item_sk, sr_returned_date_sk store_sales: ss_item_sk, ss_sold_date_sk web_returns: wr_item_sk, wr_returned_date_sk web_sales: ws_item_sk, ws_sold_date_sk call_center: cc_call_center_sk catalog_page: cp_catalog_page_sk date dim: d date sk household_demographics: hd_demo_sk income_band: ib_income_band_sk item: i_item_sk promotion: p_promo_sk reason: r_reason_sk ship_mode: sm_ship_mode_sk store: s_store_sk time_dim: t_time_sk warehouse: w_warehouse_sk web_page: wp_web_page_sk web_site: web_site_sk

2.4 Replication

Any replication of physical objects must be disclosed and must conform to the requirements of Clause 2.5.3.

No physical object was replicated.

Clause 3: Scaling and Database Population

3.1 Initial Cardinality of Tables

The cardinality (e.g., the number of rows) of each table of the test database, as it existed at the completion of the database load (see Clause 7.1.2) must be disclosed.

Table 3.1 lists the cardinality of each table as they existed upon completion of the build.

web_site	78

Table 3.1 Initial Number of Rows

3.2 Distribution of Tables and Logs Across Media

The distribution of tables and logs across all media must be explicitly described using a format similar to that shown in the following example for both the tested and priced systems.

Server Node	Disk Type	Disk drive	Description of Content
1-8	Local SATA SSD	/dev/sda /dev/sdb	Operating system, root
	Local NVMe	/dev/md127 (/dev/nvme[0-15]n1 (Soft raid 10)	TDSQL, logs, tables, temp files, swap

Table 3.2 Distribution of Tables and Logs

Table size on local storage: catalog_sales: 1696 GB catalog_returns: 129 GB store_sales: 2388 GB store_returns: 199 GB web_sales: 878 GB web_returns: 64 GB inventory: 8060 MB date_dim: 189 MB time_dim: 88 MB item: 206 MB customer: 4730 MB customer_demographics: 80 MB household_demographics: 44 MB customer_address: 1649 MB store: 92 MB promotion: 58 MB warehouse: 2608 kB ship_mode: 2352 kB reason: 3544 kB income_band: 2352 kB call_center: 5288 kB web_page: 97 MB catalog_page: 74 MB web_site: 6104 kB

3.3 Mapping of Database Partitions/Replications

The mapping of database partitions/replications must be explicitly described.

Neither database partitions nor replications are mapped to specific devices.

3.4 Implementation of RAID

Implementations may use some form of RAID. The RAID level used must be disclosed for each device. If RAID is used in an implementation, the logical intent of its use must be disclosed

For each node, a soft RAID10 volume is created on 16 PCIe NVMe drives using the mdadm command and all TDSQL data is stored in this volume.

3.5 DBGEN Modifications

The version number (i.e., the major revision number, the minor revision number, and third tier number) of dsdgen must be disclosed. Any modifications to the dsdgen source code (see Appendix B:) must be disclosed. In the event that a program other than dsdgen was used to populate the database, it must be disclosed in its entirety.

Dsdgen version 3.2.0 was used. No changes were made to the dsdgen tool.

3.6 Database Load time

The database load time for the test database (see Clause 7.4.3.7) must be disclosed.

The database load time was 319.068 seconds.

3.7 Data Storage Ratio

The data storage ratio must be disclosed. It is computed by dividing the total data storage of the priced configuration (expressed in GB) by SF corresponding to the scale factor chosen for the test database as defined in Clause 3.1. The ratio must be reported to the nearest 1/100th, rounded up. For example, a system configured with 96 disks of 2.1 GB capacity for a 100GB test database has a data storage ratio of 2.02.

Total Storage Capacity (8 Local nodes) = 929,832.46 GB (2x 960 GB and 16x 7.68TB per node should be converted to base-2)

The data storage ratio is 929,832.46 GB / 10,000 GB= 92.99

3.8 Database Load Mechanism Details and Illustration

The details of the database load must be disclosed, including a block diagram illustrating the overall process. Disclosure of the load procedure includes all steps, scripts, input and configuration files required to completely reproduce the test and qualification databases.

The tables were loaded as shown in Figure 3.8. All of the related source code and scripts are included in the Supporting Files.

Figure 3.8: Block Diagram of Database Load Process

The final database load time is (load end time – load start time).

3.9 Qualification Database Configuration

Any differences between the configuration of the qualification database and the test database must be disclosed.

The qualification database is created using the same scripts as the test database with the following exceptions:

• The Scale factor is adjusted to 1GB

All of the related source code and scripts are included in the Supporting Files.

Clause 4 and 5: Query and Data Maintenance Related Items

4.1 Query Language

The query language used to implement the queries must be identified.

SQL was the query language used to implement the queries.

4.2 Verifying Method of Random Number Generation

The method of verification for the random number generation must be described unless the supplied dsdgen and dsqgen were used.

TPC-supplied dsdgen version 3.2.0 and dsqgen version 3.2.0 were used

4.3 Generating Values for Substitution Parameters

The method used to generate values for substitution parameters must be disclosed. The version number (i.e., the major revision number, the minor revision number, and third tier number) of dsqgen must be disclosed.

TPC supplied dsqgen version 3.2.0 was used to generate the substitution parameters:

./dsqgen -streams \$stream -input ../query_templates/templates.lst -directory ../query_templates -dialect tbase - scale \$TPCDS_SCALE -rngseed \$SEED -verbose y -output_dir \$STREAM_TMP

4.4 Query Text and Output Data from Qualification Database

The executable query text used for query validation must be disclosed along with the corresponding output data generated during the execution of the query text against the qualification database. If minor modifications have been applied to any functional query definitions or approved variants in order to obtain executable query text, these modifications must be disclosed and justified. The justification for a particular minor query modification can apply collectively to all queries for which it has been used. The output data for the power and Throughput Tests must be made available electronically upon request.

Supporting Files Archive contains the actual query text and query output. Following are the modifications to the query.

The following MQM are used:

- Use vendor-specific syntax of date expressions. (MQM f.1)
 - Q5
 - Q12
 - Q16
 - Q20
 - Q21
 - Q32
 - Q37
 - Q37
 - Q40Q77

- **Q**80
- Q82
- Q92
- Q94
- Q95
- Q98
- Use column references expression in ORDER BY clause (MQM e.2)
 - Q36
 - Q70
 - Q86
- Query results are inserted in a file (Clause 4.2.5) using an external table with column delimiter
 - Q34 with readable/writable external table named q34_result_[s]_r_ext/q34_result_[s]_w_ext (stream[s])
 - Q39 with readable/writable external table named q39_result_[s]_r_ext/ q39_result_[s]_w_ext (stream[s])
 - Q64 with readable/writable external table named q64_result_[s]_r_ext/ q64_result_[s]_w_ext (stream[s])
 - Q71 with readable/writable external table named q71_result_[s]_r_ext/ q71_result_[s]_w_ext (stream[s])
 - Q98 with readable/writable external table named q98_result_[s]_r_ext/ q98_result_[s]_w_ext (stream[s])

The Supporting Files Archive contains the full set of executable query text template used in the test.

4.5 Query Substitution Parameters and Seeds Used

All the query substitution parameters used during the performance test must be disclosed in tabular format, along with the seeds used to generate these parameters.

The Supporting Files Archive contains the query substitution parameters and seed used in the test.

4.6 Refresh Setting

All query and refresh session initialization parameters, settings and commands must be disclosed.

The Supporting Files Archive contains the query and scripts, along with initialization parameters and settings.

4.7 Source Code of Refresh Functions

The details of how the data maintenance functions were implemented must be disclosed (including source code of any non-commercial program used).

The Supporting Files Archive contains the source code implementing the refresh functions.

4.8 Staging Area

Any object created in the staging area (see Clause 5.1.8 for definition and usage restrictions) used to implement the data maintenance functions must be disclosed. Also, any disk storage used for the staging area must be priced, and any mapping or virtualization of disk storage must be disclosed.

No staging area was used.

Clause 6: Data Persistence Properties Related Items

The results of the data accessibility tests must be disclosed along with a description of how the data accessibility requirements were met.

The data accessibility test was performed by failing the local storage of one node. This failure was induced during the execution of the first data maintenance test. The storage on each nodes made of 16 PCIe NVMe. The storage failure was simulated by removing access to 1 of the PCIe NVMe. The Supporting Files Archive contains the logs of status before and after the storage failures.

Clause 7: Performance Metrics and Execution Rules Related Items

7.1 System Activity

Any system activity on the SUT that takes place between the conclusion of the load test and the beginning of the performance test must be fully disclosed including listings of scripts or command logs.

The only activity between the end of the load test and the beginning of the performance test was the generation of the executable query text and the execution of audit scripts.

7.2 Test Steps

The details of the steps followed to implement the performance test must be disclosed.

The Supporting Files Archive contains the scripts and logs.

7.3 Timing Intervals for Each Query and Refresh Function

The timing intervals defined in Clause 7 must be disclosed.

See the Executive Summary at the beginning of this report.

7.4 Throughput Test Result

For each Throughput Test, the minimum, the 25th percentile, the median, the 75th percentile, and the maximum times for each query shall be reported.

See the Executive Summary at the beginning of this report.

7.5 Time for Each Stream

The start time and finish time for each query stream must be reported.

See the Executive Summary at the beginning of this report.

7.6 Time for Each Refresh Function

The start time and finish time for each data maintenance function in the refresh run must be reported for the Throughput Tests

See the Executive Summary at the beginning of this report.

7.7 Performance Metrics

The computed performance metric, related numerical quantities and the price/performance metric must be reported.

QphDS@10000GB = 72,603,042

See the Executive Summary at the beginning of this report for more detail.

Clause 8: SUT and Driver Implementation Related Items

8.1 Driver

A detailed textual description of how the driver performs its functions, how its various components interact and any product functionalities or environmental settings on which it relies must be provided. All related source code, scripts and configuration files must be disclosed. The information provided should be sufficient for an independent reconstruction of the driver.

Psql was used to submit the queries. It connects to the TDSQL instance.

The command run a SQL file

psql -h \${host} -p \${port} -d tpcds -f SQL.sql

The command run a SQL command:

psql -h \${host} -p \${port} -d tpcds -c "SQL command"

The TDSQL instance accepts SQL queries from the psql clients and processes the queries. All queries are compiled on the Coordinator node and then dispatched to the data nodes as distributed tasks. When the tasks finish, their results are collected by the Coordinator node which send the query output to the psql client.

The Supporting Files Archive contains all the command, scripts and logs.

8.2 Implementation Specific Layer (ISL)

If an implementation specific layer is used, then a detailed description of how it performs its functions, how its various components interact and any product functionalities or environmental setting on which it relies must be provided. All related source code, scripts and configuration files must be disclosed. The information provided should be sufficient for an independent reconstruction of the implementation specific layer.

No Implementation Specific Layer was used.

8.3 Profile-Directed Optimization

If profile-directed optimization as described in Clause 7.2.10 is used, such use must be disclosed. In particular, the procedure and any scripts used to perform the optimization must be disclosed.

Profile-directed optimization was not used.

Clause 9: Pricing Related Items

9.1 Hardware and Software Used

A detailed list of hardware and software used in the priced system must be reported. The rules for pricing are included in the current revision of the TPC Pricing Specification located on the TPC website (http://www.tpc.org)

A detailed list of all licensed services, hardware and software, is provided in the Executive Summary of this report.

9.2 Availability Date

The System Availability Date (see Clause 7.6.5) must be the single availability date reported on the first page of the executive summary. The full disclosure report must report Availability Dates individually for at least each of the categories for which a pricing subtotal must be. All Availability Dates required to be reported must be disclosed to a precision of 1 day, but the precise format is left to the test sponsor.

The total system is available as of the date of this report.

9.3 GCountry-Specific Pricing

Additional Clause 7 related items may be included in the full disclosure report for each country specific priced configuration.

The configuration is priced for the Chinese market.

Clause 11: Audit Related Items

Auditor's Information and Attestation Letter

The auditor's agency name, address, phone number, and attestation letter with a brief audit summary report indicating compliance must be included in the full disclosure report. A statement should be included specifying whom to contact in order to obtain further information regarding the audit process.

This benchmark was audited by: Doug Johnson, of InfoSizing.

Anqun Pan Director TEG Database R&D Department No. 16 Gaoxin South Avenue 10 Shenzhen, China

October 18, 2024

I verified the TPC Benchmark[™] DS v3.2.0 performance of the following configuration:

Platform:	Tencent Cloud TDSQL (Dedicated cluster with 8 nodes)
Operating System:	TencentOS Server 3.2
Database Manager:	Tencent TDSQL v10.3 Enterprise Pro Edition (PostgreSQL v5.21.18)

The results were:

Performance Metric 72,603,042 QphDS@10000

Secondary Metrics (seconds@10000)

Jeconu		second age 10000			
T _{Load}	319.1	T_{TT1}	731.9	T _{DM1}	25.7
TPower	372.9	T _{TT2}	804.5	T _{DM2}	24.1

System Under Test	<u>8x TC</u>)-CI81X-1	.00GS each with:
CPUs	112x v	/CPU	
Memory	1,024	GiB	
Storage	Qty	Size	Туре
	2	960 GB	SATA
	16	7.68 TB	NVMe SSD

In my opinion, these performance results were produced in compliance with the TPC requirements for the benchmark.

The following verification items were given special attention:

- The database records were defined with the proper layout and size.
- The database population was generated using DSDGen v3.2.0
- The database was properly scaled to 10,000 GB and populated accordingly.
- The primary and secondary metrics were correctly measured and reported.

63 Lourdes Dr. | Leominster, MA 01453 | 978-343-6562 | www.sizing.com

- The query templates were produced using approved minor query.
- The query substitution parameters were generated using DSQGen v3.2.0.
- The execution of the queries against the qualification database produced compliant output.
- The tests were driven and sequenced according to the requirements.
- Each throughput test comprised 4 query streams.
- The execution times for queries and data maintenance functions were correctly measured and reported.
- The data accessibility test was performed and verified.
- The system pricing was verified for major components and maintenance.
- The major pages from the FDR were verified for accuracy.

Additional Audit Notes:

None.

Respectfully Yours,

falinson

Doug Johnson, Certified TPC Auditor

63 Lourdes Dr. | Leominster, MA 01453 | 978-343-6562 | www.sizing.com
